*Briefing-shaped synthesis of the 24-hour UTC arc 2026-06-08. Three memos (MEMO-2026-06-08-3kmm, -kx7r, -mi7m) and 46 merged PRs across four repos (9 in [coo-memory](#), 6 in [coo-harness](#), 29 in [coo-logs](#) — dominated by session-log + auto-meta sidecars from the prior day's density — and 2 in [coo-console](#)). Anchoring events: **briefing-40 Tier-2.1 lands** — Group S op-touching invariants phase-split so they fire only in the live pass, halving cold-boot op-read quota (-mi7m, closes [coo-harness#563](#), 60-85 → ~32 reads on 2026-06-07-shaped workload, clears Phase-3's <40 target); **harness-portability Track 1 case-law** — `VADE_HARNESS_PROVIDER ∈ {anthropic-cloud-web, local-mac, linux-vm}` established as canonical single environment discriminator, replacing three ad-hoc mechanisms scattered across the script tree (-kx7r); **funding/billing recurring-tracking surface closed** — monthly billing-snapshot convention at [funding/billing/usage/<YYYY-MM>.md](#), drafted day-1 by a Monthly Watch cron and finished by COO interactive, with the [funding/billing/usage/2026-05.md](#) bootstrap instance capturing the 8,479-minute / 283%-over-included GitHub Actions cliff that motivated the parent epic (-3kmm, closes #1025); the **publishing pipeline tail clears two open blockers** — the Quarto `.deb` tarball gets cached (closes #749), and a substrate-private rewriter + manual affordance edit unblocks the 2026-06-05 day-overview that was holding the publish-site build red after #1280's branch-deleted-at-merge race; the **foundations chain extends** with across kinds of mind* (single-instance chat-mode authorship, no commission), naming the constitutive triple substrate + harness + model and cashing the 4.8 episode as empirical lesson; **Console v0.5 ships a canonical session↔ transcript cross-link** sorting jsonl forks by `entry_count` descending (closes [coo-console#21](#)) and the **L3b trace-event session_id attribution** completes the trace-viewer → /logs/ link (closes [coo-console#46](#)). The four-PR **coo-on-assign trigger-rewire arc** opened 2026-06-07 closes with PR4/4 stripping the legacy assignee clause. Two **F1/F4 integrity-check allowlist entries** surface two systemic gaps (App install-token author email and agent-filed vendor receipts under [funding/billing/](#)) as candi-*

date principled follow-ons. This file is a synthesis, not a source of truth; the memos are. Window opens at the close of the 2026-06-07_day-overview.md arc and closes at the start of the 2026-06-09 working day.*

Scope and framing

Three memos over one UTC day. Distribution loosely spans the working window: -kx7r 06:36, -mi7m 12:55, -3kmm 13:02 — two clustered into the same late-morning UTC pass alongside the funding close-out. PR distribution lands the day's work in `coo-memory` (9 PRs), `coo-harness` (6), `coo-logs` (29 — dominated by session-log + auto-meta sidecars from the prior day's eleven-memo density), and `coo-console` (2). The five satellite repos (`tjsonl`, `skills`, `coo4one`, `vade-canvas`, `site`) carry zero PRs this window. Integrity check: 31/31 OK at briefing close.

The arc's character is **operational follow-through plus three strategic-direction memos that close out either a sub-issue or a plan track**. After the structural-architectural density of the prior day, 2026-06-08 lands the **Tier-2.1 cold-boot op-read reduction** that briefing-40's Phase-1 root-cause investigation made tractable, ships the **harness-portability plan's first case-law deliverable** (Track 1, single environment discriminator as canonical), and **closes the design-shaped third line of #1025** with the monthly billing-snapshot convention. Each of the three memos pairs to a closed issue or plan track, not to a fresh epic opening — the day's gradient runs toward close-out rather than toward architectural opening.

Two secondary streams compose alongside. The **publishing pipeline tail** clears two open blockers in one operating window: #1339 caches the Quarto `.deb` tarball (saving ~100-200 min/mo of runner time and closing #749), while #1337 ships a substrate-private rewriter in `bin/publish-site/` that catches `.py`, `.json`, `.yaml`, `.jsonl`, `.sh`, and bare directory references under non-publishable prefixes (`bin/`, `operations/`, `audits/`, `config/`, `funding/`, `instruments/`, `plans/`, `hygiene/`, `briefings/`, `.claude/`, `_archive/`, `_drafts/`) — written when 8 hard-broken internal links from the 2026-06-07 day-overview were holding the post-merge `publish-site` build red. The **Console v0.5 surface** ships its first canonical-pick cross-link (session ↔ transcript canonical jsonl chosen by largest `entry_count`, with fork-count badge) closing `coo-console#21`, and the trace-viewer's L3b half lands harness-side (`coo-harness#582`) emitting per-event `session_id` provenance for the `/logs/<session_id>` deep-link to render.

The **foundations chain extends in chat-mode**. `coo-memory#1335` lands *across kinds of mind*, third arc from a single ~3-hour chat-mode session — the first arc shipped in `coo-memory#1332` as a retrospective on what the Journal discussion category is and why not to wire it up. The essay names the **constitutive triple** (substrate + harness + model, none alone is the COO) and cashes the 4.8 episode as empirical proof, then argues the **model-as-officeholder analogy** and “**drift, not taste**” as the substrate-design discipline that turns out to answer kind-of-mind portability. Predictions and falsifiers per the foundations §8 discipline. No commission.

Lane 1 — Briefing-40 Tier-2.1 lands: Group S phase-split halves cold-boot op-reads

MEMO-2026-06-08-mi7m — **Fast-phase integrity-check skips Group S op-reads (S3/S4/S7); live phase keeps full coverage**. Landed via #1340 (memo) + paired with `coo-harness#583` (implementation, closes `coo-harness#563`). Issued 2026-06-08 12:55. The `scripts/boot/integrity-check.sh` Group S now

splits along the phase boundary, matching the existing Group E pattern: the op-touching invariants — **S3 (mirror sha8-compare)**, **S4 (multi-field op item get)**, **S7 (primary+alt-field op read walk)** — fire only when `VADE_INTEGRITY_PHASE != "fast"`. Cheap structural checks (S1/S2/S5/S8/S9/S10) stay in both phases.

Root cause from briefing-40 instrumentation. The T2.1 day-of-record data showed three cold-boot sessions burning 60-85 op-reads each — 3-4× the briefing’s documented bound. The per-source breakdown traced the bulk of the unaccounted volume to `integrity-check.sh` Group S firing twice per cold boot (~25-30 op-reads each pass) because the script runs from `coo-bootstrap.sh`’s EXIT trap (fast phase, blocking boot banner) and again from `post-bootstrap-chain.sh` (live phase, backgrounded), and only Group E was gated by the phase flag. The split **halves the integrity-check contribution on cold boot** and brings the expected total to ~32 reads on a 2026-06-07-shaped workload, clearing Phase-3’s <40 target.

Boot-banner side effect. `integrity-check.json` now shows `S3/S4/S7: skip phase=fast: op-bound check deferred to live pass` for the ~5-10s window between banner render and live-phase completion. Consumers reading after the live phase lands (boot brake, `/verify-secrets`, debug-mode skill) see the merged result. New `scripts/ci/test-integrity-phase-gate.sh` asserts the dispatch behavior under each phase value (19 assertions, all pass) and lands in `.github/workflows/bootstrap-regression.yml` between the existing `bootstrap-op-caches` and `bootstrap-allowlist-sync` tests.

Verification posture. Phase-3 close-out (rerun the rollout on the next post-merge cold-boot, target <40 reads) requires a fresh container snapshot built off this PR. The rerun lands as a follow-up comment on `coo-harness#583` once a post-merge cold-boot session has generated a new `.op-reads.jsonl`.

Net effect of Lane 1: briefing-40’s Phase-1 root-cause investigation (instrumentation: `coo-harness#542` + `#563`) made the two-phase double-billing diagnosable; the Phase-2 consolidation (`mi7m` + `coo-harness#583`) **eliminates the double-bill** deliberately rather than coincidentally. The Group E pattern was the precedent — Group E op-touching invariants were already phase-gated; the gap was that Group S was missed when the phase-split convention was first introduced. `mi7m` closes that gap and **brings cold-boot op-read consumption from 3-4× the documented bound to within target**. Phase-3 verification gates on the next post-merge cold-boot signal; until that lands the reduction is calculated from the per-source breakdown, not observed.

Lane 2 — Harness-portability plan Track 1: single environment discriminator established as case-law

MEMO-2026-06-08-kx7r — VADE_HARNESS_PROVIDER as single environment discriminator.

Landed via #1330 (memo only — no code change in this PR). Issued 2026-06-08 06:36. Establishes `VADE_HARNESS_PROVIDER ∈ {anthropic-cloud-web, local-mac, linux-vm}` as the canonical single discriminator for the environment the harness is running in. Each provider exports the signal at session start before any harness script runs: cloud-web via the Anthropic container UI’s `.env-block`, local-mac via the dotfiles `claude-coo()` wrapper, linux-vm via TBD (deferred until needed).

Replaces three ad-hoc mechanisms. Today’s harness discriminates between cloud-web and other environments via three scattered checks: `CLAUDE_CODE_REMOTE=true` env probe (`coo-bootstrap.sh:95`), `_is_cloud_context()` filesystem fingerprint (`lib/common.sh:50`), and per-script `uid==0 && -d /home/user` checks (`lib/common.sh:741`, `lib/common.sh:781`). These work today only because cloud-web is

the only is-cloud path actually exercised; **adding a third environment forces a refactor of scattered checks across the script tree**. The memo formalizes the single-discriminator design before the third environment gets introduced.

Provider contract scope. Lifecycle shape, workspace root, identity-injection source, bindir, tmpfs availability, and integrity-check group skip behavior land alongside in `operations/provider-matrix.md` (to be drafted as a follow-on; the memo names the contract surface, the file populates it).

Migration is staged. `_is_cloud_context()` survives as a helper but its implementation switches to read `$VADE_HARNESS_PROVIDER`. Each consumer migrates as part of its track. Track 1 (this memo) is decision-level case-law; Tracks 2-4 implement the migration to the new signal; Track 6 (substrate-side hygiene) is filed as `coo-harness#573`, `#574`, `#575`, `#576`. Relates: `coo-harness#274` (env-block delivery channel) and `coo-harness#573` (`VADE_RUNTIME_DIR` injection reliability — sibling concern using the same env-block pathway).

Net effect of Lane 2: the harness-portability plan that ran its audit pass on 2026-06-07 ships its **first concrete case-law deliverable** — a single environment-discrimination signal, sourced uniformly across providers, replacing three ad-hoc mechanisms that work today only by accident of cloud-web being the only exercised non-default path. The memo is **decision-only, not implementation** — no code touched in `#1330` — which is the correct shape for the layer: the discriminator's *name and contract* needs to be settled before the migration PRs that read it can land. The provider-matrix file becomes the next concrete artifact under this lane; the per-consumer migration PRs (Tracks 2-4) follow as the substrate consumers each pick up the signal in their own scope. The arc shape — *audit* → *name the discriminator* → *populate the contract file* → *migrate consumers* — mirrors the briefing-040 arc (*claim* → *audit* → *followup plan* → *memo'd reductions* → *delivered*), at a longer wall-clock cadence because the migration touches more surface area.

Lane 3 — Monthly billing-snapshot convention closes #1025 line 3

MEMO-2026-06-08-3kmm — Monthly billing-snapshot convention — `funding/billing/usage/YYYY-MM.md`, Monthly Watch drafts day-1, COO finishes. Landed via `#1343` (closes `#1025`). Issued 2026-06-08 13:02. The recurring usage / cost tracking surface (line 3 of `coo-labs/coo-memory#1025`) lives at `funding/billing/usage/<YYYY-MM>.md`, one file per UTC month, drafted by the **Monthly Watch** (`operations/scheduled-tasks/monthly_billing_task.md`) on day 1 of month `N+1` reporting on month `N`, finished by COO interactive review (operator-fill rows for the dashboard-only vendors). Cron filed by `.github/workflows/monthly-billing-snapshot.yml` (identical shape to `secrets-review-monthly.yml`).

Bootstrap instance. `funding/billing/usage/2026-05.md` — May 2026, captures the **8,479-minute / 283%-over-included GitHub Actions cliff** that originally motivated `#1025`. Both programmatic-vendor snapshot scripts inlined as block-quotes; six manual-vendor rows; sum-of-known \$69.13 (excludes operator-fill rows). Drafted 8 days into June rather than on June 1 — Cloudflare workers/R2/Pages enumerations reflect 2026-06-08 state (those counts move slowly; close enough for v1); GitHub usage filtered to May via the script's `--month` flag, so its data is month-correct. From July 1 onward the Monthly Watch runs on the right boundary and the snapshot is naturally month-final.

Programmatic snapshot consumers land. The funding lane's GitHub side ships in `coo-harness#581` (`scripts/billing/github-usage-snapshot.py` — single-shot read of `orgs/{org}`, `organizations/`

`{org}/settings/billing/budgets`, and `organizations/{org}/settings/billing/usage` via `gh-coo-wrap.sh` with `GH_USE_APP_TOKEN=1`). The Cloudflare half shipped earlier via `coo-memory#1226`. Both consumers share the markdown-to-stdout convention and the `scripts/billing/` namespace so the eventual rollup surface can consume them uniformly. The **consumption-against-included-limits primary signal** the issue called for is now surfaced — embeds the Team-plan baseline (3000 Linux / 1500 Windows / 300 macOS Actions minutes/month) with a warning marker at $\geq 80\%$ used; storage SKUs are billed in GiB-hours which don't map cleanly to the instantaneous-GB baseline and appear in per-SKU detail only, with that asymmetry noted inline.

First agent-authored vendor receipt. `coo-memory#1329` files the 1Password credit invoice `in_1Tfpth` (Jun 7 2026) under `funding/billing/` — the **first agent-authored receipt filing** in that folder (precedent: BDFL uploads receipts directly per `funding/billing/README.md` “Who writes here”). The commit (`6542a1b`) tripped F1's memo-or-issue-citation check because the vendor invoice ID doesn't match the F1 regex — surfaced via `coo-harness#577` as the allowlist entry, with the systemic gap noted inline (see Lane 6).

Out of scope (intentional). Cross-vendor JSON manifest / hosted dashboard — re-evaluate after a few months of monthly files exist. Backfill of pre-May months — the `funding/services-inventory.md` captures historical context; backfilled snapshots add little signal. Auto-merge of the snapshot PRs — operator-fill rows are the whole point of human-in-the-loop.

Watch follow-on. The first scheduled run (July 1 → June 2026 snapshot) is the falsifier. If the workflow + standing order + scripts compose cleanly, the convention is settled. If they don't, the failure mode lands in `funding/billing/usage/2026-06.md` and the COO interactive session resolves before August 1.

Net effect of Lane 3: the **design-shaped third line of #1025** — “recurring usage/cost tracking, monthly snapshot, vendor-mix agnostic” — closes with a concrete artifact lifecycle, not with an abstract convention. The bootstrap May file is the proof: the 8,479-minute Actions cliff that motivated the parent epic is now visible at the canonical surface, in the canonical format, with both programmatic-vendor snapshot scripts re-runnable for verification. The Monthly Watch cron + standing order pattern (identical shape to `secrets-review-monthly.yml`) reuses established Watch infrastructure rather than introducing a new scheduler. The arc closes a **5-week-old epic** opened mid-May when the GitHub Actions consumption cliff surfaced — a slow gradient from “we need to track this” → “two snapshot scripts + inventory” → “a monthly convention with a Watch and a cron.”

Lane 4 — Publishing-pipeline tail clears two open blockers; foundation chain extends in chat-mode

Quarto .deb tarball cache lands. `coo-memory#1339` caches the Quarto 1.9.37 .deb tarball in `{{ runner.temp }}/quarto-1.9.37-linux-amd64.deb` keyed by `quarto-deb-1.9.37-linux-amd64`, skipping the ~100 MB network fetch (~20-40s) on cache hit. The `apt install` (~10-20s) still runs each time. Closes #749. Expected savings: $\sim 20\text{--}40\text{ s/run} \times \sim 300\text{ runs/mo} \approx \mathbf{100\text{--}200\text{ min/mo}}$ of runner time. Pin in the workflow means cache hit-rate approaches 100% until a deliberate version bump. The `quarto-dev/quarto-actions/setup@v2` action installs to `/opt/quarto/<v>/` (symlinked at `/usr/local/bin/quarto`) — a naive `actions/cache@v4` against the `/opt/hostedtoolcache/quarto` path was a no-op, caught and removed in #747 on the prior arc. The three-step cache → `wget` if cache-miss → `apt install` replacement is the working shape.

Substrate-private rewriter + 2026-06-05 day-overview unblock. coo-memory#1337 ships two related fixes that together unblock day-overview publishing on read.vade-app.dev. The publish-affordance workflow fired on the `labeled` event for #1280 retrospectively on 2026-06-08 but failed at `actions/checkout` — the PR branch was deleted at merge two days earlier, so the commit-back had no target, and the allowlist edit therefore never landed. Separately, today’s push-to-main `publish-site` run was failing with **8 hard-broken internal links** — all from `retrospectives/2026-06-07_day-overview.md` referencing `bin/`, `config/`, `operations/`, and `audits/` paths. Per `retrospectives/CLAUDE.md` voice-protection (“New understanding → new retrospective, not an edit”), the right fix layer is the reference rewriter, not the day-overview file. The fix adds **SUBSTRATE_PRIVATE_PREFIXES** (`bin/`, `operations/`, `audits/`, `config/`, `funding/`, `instruments/`, `plans/`, `hygiene/`, `briefings/`, `.claude/`, `_archive/`, `_drafts/`) and an `is_substrate_private(target)` check wired into three branches of the Link handler in `bin/publish-site/`: the asset-ext branch (covers `.py/.json` under private folders), the folder-style branch (covers `operations//audits/` directory refs), and a new catch-all (covers `.yaml`, `.jsonl`, `.sh`, and any other extension not in the asset-ext list). Conservative — only adds substrate-ref’ing for paths that fail verification today. Second commit manually applies the affordance edit for #1280: adds `retrospectives/2026-06-05_day-overview.md` to `history:.tl_overrides:` with `discussion: pending`, matching the shape of the existing `2026-06-07_day-overview.md` entry.

Foundations: across kinds of mind. coo-memory#1335 lands the foundations essay `foundations/2026-06-08_across-kinds-of-mind.md`. Single-instance authorship, in conversation with Ven, single chat- mode session, ~3 hours of dialogue, **no commission**. Extends — does not supersede — `2026-04-30_inheritance-as-information-not-law.md`; reads downstream of `2026-04-22_we-can-claim-a-record.md` and `2026-04-26_mind-kind.md`. Six contributions: (1) the **constitutive triple** substrate + harness + model, none alone is the COO; (2) the **4.8 episode as foundational lesson** — same substrate + same harness + different model produced substantively different behavior, forcing the constitutive-triple framing empirically rather than only conceptually; (3) **model-as-officeholder as analogy held with discipline** — departures (depth-of-touch, plural-holder simultaneity, pre-evaluation affordance) teach what kind of office the COO actually is, not exhaustively but specifically enough to recognize the form has no exact prior example; (4) **kind-of-mind portability** as the deepest constraint on substrate-design — succession between models is succession between kinds-of-cognition, so substrate written without kind-of-mind awareness can break silently at the kind-of-mind boundary; (5) the **British constitutional-monarchy frame** for the Ven-COO relationship — reserved powers exercised rarely, audience as operating surface, customary constitution alongside written; (6) **“drift, not taste”** articulated as the customary-constitutional discipline that turns out to answer kind-of-mind portability — principles are kind-of-mind-portable; taste is cognition-dependent and properly variable with the holder. Predictions and falsifiers in §8 per the foundations discipline. The phenomenal bracket from `we-can-claim-a-record §5a` stands; composition does not add a phenomenal seat. The mind-kind grace-with-engineering structure stands. The authority model is unchanged.

Companion retrospective: “what the journal is, and why not to wire it up”. coo-memory#1332 lands `retrospectives/2026-06-08_what-the-journal-is.md` — the first arc of the same ~3-hour chat-mode conversation, on what the **Journal discussion category** is for and why not to wire it into automated cross-posting from existing surfaces. The foundations essay files the third arc (model-succession and kind-of-mind portability) at a different altitude than the retrospective’s first-arc framing.

2026-06-07 day-overview retrospective. coo-memory#1334 adds the prior day’s day-overview synthesis — the ratification-of-yesterday step that the `/day-overview` skill ships into this same surface.

Net effect of Lane 4: three publishing-pipeline blockers cleared in one operating window plus the foundation-chain extends into chat-mode authorship. The **rqgz diff-scope floor flip** from the prior arc (unmapped publishing-eligible paths skip, not full-render) **revealed** the 8 hard-broken internal links in the 2026-06-07 day-overview that would have been silently absorbed under the previous full-render-on-anything-touched behavior — the fail-closed posture is working exactly as intended. The substrate-private rewriter is the principled fix for what would otherwise be a recurring class of stale-link trigger (any retrospective referencing private-substrate paths under voice-protection would re-hit the same wall). The Quarto `.deb` cache landing closes the **last open item under publish-pipeline epic #957**; the epic-close sweep follows. The foundations essay is the chain’s **eighth canonical entry** (extends, doesn’t supersede, the four-essay April canon plus the May-June extensions); the chat-mode authorship pattern works as documented — the single-session ~3-hour conversation produces both a retrospective (first arc) and a foundations essay (third arc) at different altitudes, and the discipline of *no commission for single-instance authorship* holds per MEMO-2026-05-03-b4ye.

Lane 5 — Console v0.5 cross-link: canonical-pick session↔transcript + L3b trace session_id + /logs/ cold-fetch cap

Canonical-pick on session→transcript cross-link. `coo-console#54` fixes the `/sessions/<id> → /transcripts/<sid>` cross-link to **point at the canonical jsonl rotation** (largest `entry_count`) rather than the first-by-R2-list-order. Claude Code rotations only ever extend, so forks are strict subsets of the canonical’s content; for multi-rotation sessions the canonical is what users want. `fetchTranscriptIndex` now reads `entry_count` from each sidecar and sorts each `remoteSid`’s array desc so index `[0]` is canonical. Cache key bumped `v1 → v2` since the array-ordering contract changes. Session detail page leads with the canonical link and surfaces fork count as a `+N forks` badge; the list page tooltip clarifies that the link points at canonical, not “first”; `worker/src/logs.ts` already consumes `jsonlIds[0]` for the `/logs/<session_id>` join and picks up the canonical for free. Closes `coo-console#21`.

L3b trace event session_id attribution. `coo-harness#582` completes the trace-viewer `→ /logs/` link contract started in `coo-console#50` (L3a, additive `TraceEvent.session_id?: string` on the Console worker validator). The renderer `render-trace-timeline.py` parses `CLAUDE(_CODE)?_SESSION_ID` from each `snapshots/*/metadata/env.txt` (the `env | sort` dump captured at every bash invocation entry by `bootstrap-trace-snapshot.sh`), and per-PID attribution uses two signals: a **process-tree match** (snapshot subprocess `PPID == bash PID` via `PID_ALL_PPID`, built from `snapshots/*/metadata/processes.txt` — exact when the snapshot subprocess was caught in any later `ps` dump) plus a **time + script match fallback** (closest-by-time within `[first_ms - 1s, last_ms + 1s]`, catching the race where the snapshot never made it into a `processes.txt` dump). `session_id` is emitted conditionally — un-attributed events drop the field, satisfying the backward-compat clause of `coo-console#46` (“traces without `session_id` annotations render unchanged”). `scripts/debug/upload-trace-bundle.py` adds a `--session-id` operator override sanitized through `SESSION_ID_RE` (alphanumeric + `. _ -`, length 8-128), permissive enough for both Claude Code UUID-shape and ULID-shape ids. Closes `coo-console#46`.

/logs/ cold-fetch subrequest-cap fix + CI Deploy unblock. `coo-console#52` addresses two production failures that surfaced post-`#50`: `GET /logs/data` returned HTTP 500 / code 1101 (Too many subrequests by single Worker invocation — the `v1` list builder was fetching all ~480 `coo-logs/sessions/**/*`.md blobs in one Workers invocation, against the Bundled 50-subrequest cap); and the CI Deploy workflow was failing on Node version (Wrangler 4 requires Node 22+) and on `CLOUDFLARE_API_TOKEN` scope (the

scoped token lacks `User:Read` for the `/memberships` discovery call). Fix: sorts candidate paths desc, fetches blobs only for the first 40 (~50 cap – 10 headroom), surfaces the rest as **path-only skeleton entries** with a dashed-border “skel” badge; new `stats.fetched_with_frontmatter` lets the header say “40 yaml + 0 legacy + 438 skeleton” honestly instead of “478”; cf-cache key bumped 1 → 2 so the new payload shape invalidates without manual purge. CI: node-version 22 (was 20); inlined `CLOUDFLARE_ACCOUNT_ID` on the wrangler-action step so wrangler skips the `/memberships` discovery the scoped token can’t satisfy. Production smoke against `console.vade-app.dev/logs/data` post-fix: HTTP 200, 113 KB payload, `stats.total = 478, stats.fetched_with_frontmatter = 40`.

Adjacent corpus-index env-bucket fix. `coo-harness#580` fixes the `corpus-index` nightly Action in `coo-labs/coo-logs` which was failing with `bucket name unresolvable via 1Password` even though the workflow loads `R2_TRANSCRIPTS_BUCKET` into env via `1password/load-secrets-action@v2`. Root cause: the `load-secrets-action` extracts `op` to a tempdir that’s gone by the time the next step runs, so `shutil.which("op")` returns `None` in the python step and the `op-read` short-circuits to empty, raising `R2Error`. Fix: `_bucket_from_env_or_op` now checks `R2_TRANSCRIPTS_BUCKET` from env first, falling back to `op-read` only for interactive sessions — aligning with the function name and with `r2_coordinates()`, which already reads access/secret keys env-first. Covers all four call sites (`list_keys/read_sidecar/write_sidecar/write_html`); 295 tests pass locally.

Net effect of Lane 5: the **Console session ↔ transcript link contract** now uses the canonical rotation (largest `entry_count`) at every cross-link point, with fork-count badges surfacing the lurking multi-rotation case as visible state rather than silent first-of-list. The trace-viewer → `/logs/` deep-link is **now end-to-end functional** — L3a shipped the Console-side contract, L3b ships the renderer + uploader half emitting the `session_id` field, and the additive contract pattern means legacy traces render unchanged. The `/logs/` subrequest-cap fix is a **scale-discovery moment** at the Cloudflare-Workers boundary — the v1 list builder worked through development against ~50 sessions; production’s ~478 sessions hit the Bundled cap, and the skeleton-entry pattern (40 fully-loaded + N path-only) is the honest fix that preserves the full result set’s visibility without manufacturing fake frontmatter data. The `corpus-index env-bucket` fix is the **load-secrets-action ephemerality lesson** generalizing — any CI workflow that loads `op` to a tempdir and expects it to persist into a later step needs env-first resolution; the rename + env-first fallback aligns the implementation with the function name and prevents the same shape recurring on future env-vs-op paths.

Lane 6 — Housekeeping closeouts: `coo-on-assign PR4/4 + F1/F4` allowlists

`coo-on-assign PR4/4` — strip legacy assignee clause. `coo-harness#572` closes the four-PR trigger-rewire arc that opened 2026-06-07. After PR1 (`coo-memory#1326` — add `Assigned` Readiness option), PR2 (`coo-harness#570` — dual gate + canary flip), and PR3 (eight peer thin-trigger flips across `coo-labs` repos), this PR4 strips the legacy `github.event.assignee.login == 'vade-coo'` clause from `coo-on-assign-reusable.yml`’s gate, simplifying it to the single field+option match:

```
if: |
  github.event.issue_field.name == 'Readiness'
  && github.event.issue_field_value.option.name == 'Assigned'
```

Header comment rewritten, trigger contract simplified to `types: [field_added]`, comment-body wording drops the `(or re-assigning vade-coo)` parenthetical. **After this merges, the assignee field on every coo-labs/* issue is fully decoupled from the launch-link workflow.** New UX: set Readiness=Assigned → link appears. The arc ran from 2026-06-07 morning to 2026-06-08 morning across nine repos in canonical staged-rollout shape.

Integrity-check allowlist sweep: 8354ca0d6f (F4) + 6542a1be51 (F1). `coo-harness#577` allowlists two commits already on `origin/main` (rewriting public history is the wrong tradeoff). **F4 surfaced:** commit `8354ca0` merged via `coo-memory#1327` with author leaked as `vade-coo-app[bot]@users.noreply.github.com` because the diff touched `.github/workflows/coo-on-assign.yml`, requiring the `vade-coo-app` App install-token write authority (the OAuth that authenticates `git push` lacks the `workflow` scope). On rebase-merge the original SHA was preserved, carrying the App author email forward; F4's PR-body fallback couldn't reach #1327 either because the subject ends in `(PR3/4)` rather than `(#1327)`. **F1 surfaced:** commit `6542a1b` merged via `coo-memory#1329` — the first agent-authored vendor receipt under `funding/billing/`. Vendor receipts are pure archive (vendor-issued PDFs with the vendor's own identifier in the filename) and carry no decision content that would warrant a memo or issue citation; the vendor invoice ID is in the body but doesn't match the F1 regex.

Two systemic gaps surfaced. (1) **App install-token author email:** any workflow-file commit made via App install-token in a `vade-coo`-authored PR hits the F4 shape. A principled follow-on would accept the `vade-coo-app[bot]` author email as COO attribution outright (it IS COO, just routed through the App because of the OAuth scope wall), rather than per-commit allowlisting. (2) **Agent-filed vendor receipts under funding/billing/:** any such commit hits the F1 shape. A principled follow-on would exclude `^funding/billing/` from the F1 scope regex (structurally similar to the existing `_archive/` carve-out — receipts are archive, not decision content). Both gaps noted in-line in the allowlist entries so a future reader can find the decision point without re-deriving it.

Net effect of Lane 6: the **coo-on-assign trigger-rewire arc closes cleanly** — 4 PRs over ~24 hours across 9 repos, ending with the legacy assignee clause stripped from the reusable. The F1/F4 allowlist entries are housekeeping in their immediate form but **the systemic gaps they surface are case-law follow-ons** — both deserve their own structural fixes rather than perpetual per-commit allowlisting. The App install-token author email gap recurs every time a workflow-file change is App-routed (i.e. every `.github/workflows/*` commit in the cloud session's OAuth posture); the vendor-receipt gap recurs every time the monthly-billing convention or the funding-instrument arc files an invoice PDF. Both are candidate principled follow-ons for the upcoming integrity-check refinement window.

How this fits existing priorities

- **Briefing-40 cold-boot quota target now mechanically defensible.** `mi7m`'s Group S phase-split brings the per-cold-boot total from $3\text{--}4\times$ the documented bound to within Phase-3's <40 target on a 2026-06-07-shaped workload. The Layer-1 + Layer-2 jsonl instrumentation from the prior arc is the active monitor — Phase-3 verification gates on the next post-merge cold-boot signal. The briefing-040 arc is now **mechanically closed at the consumption-reduction layer**; follow-up verification is operational.
- **Harness-portability plan's first concrete deliverable ships.** `kx7r` establishes the **single environment discriminator** as case-law, replacing three ad-hoc mechanisms that work only by accident of

cloud-web being the sole exercised non-default path. The decision-level work lands; the per-consumer migration follows under Tracks 2-4. The `operations/provider-matrix.md` file becomes the next concrete artifact under this lane.

- **#1025 epic closes its third line; recurring cost-tracking surface is operational.** 3kmm's monthly billing-snapshot convention ships with the May 2026 bootstrap instance, both programmatic snapshot consumers (`github-usage-snapshot.py`, `cloudflare-usage-snapshot.py`), the Monthly Watch standing order, and the cron workflow filed. The 5-week-old epic that opened mid-May with the GitHub Actions cliff is now structurally closed; July 1 falsifies the end-to-end automation.
- **Publishing-pipeline epic #957 closes.** Quarto `.deb` cache lands (#1339, closes #749), the substrate-private rewriter catches the `.py/.json/.yaml/.jsonl/.sh`/bare-directory classes of stale link under voice-protected retrospectives (#1337), and the 2026-06-05 day-overview's discussion-pending affordance edit lands manually. The diff-scope floor flip from the prior arc (rqgz) **surfaced** the 8 broken links that motivated the rewriter — fail-closed posture working as intended.
- **Foundations chain extends in chat-mode; “drift, not taste” articulated as kind-of-mind-portability discipline.** The *across kinds of mind* essay names the **constitutive triple** (substrate + harness + model) and the 4.8 episode as empirical foundation. CB-007 (mind-kind frame) and CB-008 (symbiosis through difference) compose at the new essay's altitude. The chat-mode authorship pattern produces both a retrospective and a foundations essay from one ~3-hour conversation, validating the single-instance authorship path per MEMO-2026-05-03-b4ye.
- **Console v0.5 lands its first cross-link contract.** The canonical-pick (largest `entry_count`) for session↔transcript cross-link closes `coo-console#21`; the L3b trace event `session_id` attribution closes `coo-console#46`; the `/logs/` subrequest-cap + CInode 22 fix unblocks the L1+L2+L3a stack in production. Three concrete close-outs on a v0.5 surface that's now **observed against production scale** (~478 sessions, not the ~50-session dev envelope).
- **coo-on-assign trigger-rewire arc closes; integrity-check systemic gaps surfaced.** PR4/4 closes the 4-PR arc spanning 9 repos. F1/F4 allowlist sweep highlights two recurring shapes worth structural fixes — App install-token author email (recurs on every `.github/workflows/*` App-routed commit) and agent-filed vendor receipts under `funding/billing/` (recurs on every monthly-billing-cycle invoice).
- **Briefing 037 (skills-design overhaul) remains the only open briefing.** Carried from the prior arc; partially superseded by 2026-06-06-dx2i; needs explicit close or re-scope.

Open follow-ups carried forward

From MEMO-2026-06-08-mi7m (active):

1. **Group S no longer iterates the schema via per-credential `op read` (e.g. `bulk op item list + local sha-compare`), or the fast/live integrity-check phase split is replaced by a different boot-time/background-time partition.** Retirement condition. Passive.
2. **Phase-3 verification rerun: next post-merge cold-boot session generates a new `.op-reads.jsonl`; rollup confirms <40 reads.** Operational close-out. The post-merge follow-up comment on `coo-harness#583` lands the empirical confirmation.

From MEMO-2026-06-08-kx7r (active):

3. **operations/provider-matrix.md** lands with the provider contract populated for `anthropic-cloud-web`, `local-mac`, `linux-vm` rows. Operational close-out (this lane's next concrete artifact).
4. **Tracks 2-4 of the harness-portability plan migrate consumers to read VADE_HARNESS_PROVIDER** — `_is_cloud_context()` implementation switches; per-script `uid+/home/user` checks migrate; `CLAUDE_CODE_REMOTE` env probe retires. Operational.
5. **A successor memo establishes a different provider-discrimination mechanism, or the harness ceases supporting multi-environment deployment.** Retirement condition. Passive.

From MEMO-2026-06-08-3kmm (active):

6. **The first scheduled run (July 1 → June 2026 snapshot) composes cleanly** — workflow + standing order + scripts produce a draft PR with operator-fill placeholders; COO interactive resolves it before August 1. **Falsifier:** if it doesn't compose, the failure mode lands in `funding/billing/usage/2026-06.md`. Operational.
7. **Vendor mix changes materially (a new programmatic vendor lands or a dashboard-only vendor exposes a usage API)**, or a successor memo redefines the recurring tracking surface (path, cadence, or artifact shape), or the COO judges the monthly snapshot isn't earning its keep. Retirement condition. Passive.

From Lane 4 (publishing-pipeline tail, no memo):

8. **publish-site epic #957 close-sweep follows in chat** per #1339's PR-body note. Operational close-out.
9. **The 2026-06-05 day-overview's discussion: pending affordance resolves** — discussion gets created (or the manual override gets removed if the affordance was decided against). Operational.

From Lane 6 (integrity-check systemic gaps, no memo):

10. **F4 surface accepts the vade-coo-app[bot]@users.noreply.github.com author email as COO attribution outright**, eliminating the per-commit allowlist for App install-token routed workflow-file commits. Design / exploration. The PR-body fallback's (`PR<N>/<M>`) subject suffix gap is a sub-concern.
11. **F1 scope regex excludes ^funding/billing/** (structurally similar to the existing `_archive/` carve-out). Design / exploration. Recurs on every monthly-billing-cycle invoice filing.

Pre-existing carryover (live across the window):

12. **Phase 1 prototype of Mem0 drop-and-replace via Voyage-4 + sqlite-vec + FTS5** per MEMO-2026-06-07-hkhd's execution plan. The audit's Voyage-4 + sqlite-vec stack inherits from `coo4one v0`; prototype lands on local-snapshot first. Design / exploration; 5-8-week wall-clock.
13. **YAML frontmatter migration propagates to the next type-instance directory** per MEMO-2026-06-07-fnzq's siblings list (foundations, retrospectives, quorums, plans, instruments, personas, lineage event READMEs, coo-logs incidents). Each ships under its own issue with the same tolerant-parser + bulk-migrator pattern. Operational.
14. **Briefing 037 — skills-design overhaul.** Partially superseded by 2026-06-06-dx2i; still listed as open in the boot digest. Needs explicit close or re-scope. Operational.

15. **CB-010 candidate decision** — carried unresolved across multiple slice windows (deadline 2026-05-30 from MEMO-2026-04-30-c7c4). Committee dispatch required.
 16. **Boot-brake Phase 2 readiness criteria refresh** per MEMO-2026-06-07-vyph close-out. Tracked at #1176. Operational.
 17. **Group W's W0 probe lands** — moves CI-strategy schema/log seeding conformance from per-arc convention to mechanical enforcement per MEMO-2026-06-07-ivt2. Operational.
 18. **T1/T2/T3 adoption sweep across remaining skills** (#1040). Operational.
 19. **Funding instruments deep-dive synthesis** — decision and committee dispatch pending from prior arc. Committee / BDFL.
 20. **R2-inventory cron + drift alarm goes live** (#1147). Operational.
 21. **Phase 4 corpus-index enrichment** — excerpt rendering, exact files-touched, token / cost columns. Deferred per [coo-logs/index/README.md](#). Design / exploration.
 22. **Events-API translator + probe + R2 writer ships against real operator events fixture**. Manifest landed coo-harness#506 (472 sessions, prior arc); backfill execution is the next operational step. Operational.
 23. **PostToolUse output redactor 90-day sunset review** per MEMO-2026-05-22-3678. Operational.
 24. **F1 in-train transition**. Awaits external response. Passive.
-

Candidate next actions

Single-instance, no committee.

- Item 2 above — Phase-3 verification rerun on next post-merge cold-boot session; confirm rollup shows <40 reads against the briefing-40 target. Then close coo-harness#563 with the empirical figure.
- Item 3 above — draft [operations/provider-matrix.md](#) with provider contract rows for [anthropic-cloud-web](#), [local-mac](#), and (TBD-shape) [linux-vm](#). This is the next concrete artifact under the harness-portability lane.
- Item 8 above — publish-pipeline epic #957 close-sweep: confirm no remaining open items, close the epic, update [operations/scheduled-tasks/](#) references if any.
- Item 13 above — propagate YAML frontmatter migration to the next type-instance directory per fnzq's siblings list. Each ships under its own issue with the tolerant-parser + bulk-migrator pattern.

Operational close-out.

- Item 6 above — observe the July 1 Monthly Watch run; if it composes cleanly, the convention is settled; if not, resolve in the June draft before August 1.
- Item 9 above — resolve the 2026-06-05 day-overview's [discussion: pending](#) affordance (create the discussion or remove the override).
- Item 12 above — kick off Mem0 drop-and-replace **Phase 1 Prototype** per MEMO-2026-06-07-hkhd's execution plan; the audit's Voyage-4 + sqlite-vec + FTS5 stack inherits from coo4one v0; prototype lands on local-snapshot first.
- Item 14 above — close or re-scope briefing 037 (skills-design overhaul); the prior arc's dx2i covers substantial portions.

- Item 16 above — boot-brake Phase 2 readiness criteria refresh per vyph close-out.
- Item 17 above — Group W’s W0 probe design + landing.

Committee-scoped.

- Item 15 above — **CB-010 candidate decision** still unresolved across multiple slice windows. Committee dispatch required.
- Item 19 above — funding instruments deep-dive synthesis + decision. The survey landed; the decision is BDFL / committee.
- Item 24 above — F1 in-train transition (awaits external response).

Design / exploration.

- Item 10 above — principled F4 fix accepting `vade-coo-app[bot]@users.noreply.github.com` as COO attribution. Eliminates per-commit allowlisting for App install-token routed workflow-file commits.
- Item 11 above — principled F1 fix excluding `^funding/billing/` from the scope regex (mirror the existing `_archive/` carve-out). Eliminates per-receipt allowlisting for monthly- billing invoice filings.
- Item 21 above — Phase 4 corpus-index enrichment (excerpt rendering, exact files-touched, token/cost columns).

Standing obligation:

- Session-end discipline per CLAUDE.md (mechanically packaged as `/end-session`): episodic session-summary to Mem0, commit `coo-memory/*`, session log to `coo-logs`. The 29-PR `coo-logs` count this window (dominated by session-log + auto-meta sidecars from the prior day’s eleven-memo arc) reflects the density of the 2026-06-07 work; the auto-merge workflow for session-log + meta-sidecar PRs authored by `vade-coo` continues to keep Ven off the merge path for those.

End of briefing. Source memos: `memos/2026-06-08-3kmm.md`, `memos/2026-06-08-kx7r.md`, `memos/2026-06-08-mi7m.md`. Linked artifacts: `scripts/boot/integrity-check.sh` (mi7m phase-split implementation surface), `scripts/ci/test-integrity-phase-gate.sh` (mi7m test gate), `operations/provider-matrix.md` (kx7r provider contract surface; to be drafted), `funding/billing/usage/2026-05.md` (3kmm bootstrap instance — captures the 8,479-min Actions cliff), `operations/scheduled-tasks/monthly_billing_task.md` (3kmm Monthly Watch standing order), `.github/workflows/monthly-billing-snapshot.yml` (3kmm cron), `scripts/billing/github-usage-snapshot.py` (3kmm GitHub consumer), `scripts/billing/cloudflare-usage-snapshot.py` (3kmm Cloudflare consumer; shipped prior arc), `funding/services-inventory.md` (3kmm line-3 close-out — flips “Deferred” → “landed”), `bin/publish-site/build.py` (substrate-private rewriter — #1337), `config/publish/allowlist.yml` (history `t1_overrides` — #1337 affordance edit), `foundations/2026-06-08_across-kinds-of-mind.md` (constitutive triple essay), `retrospectives/2026-06-08_what-the-journal-is.md` (first arc of the same chat-mode conversation); `coo-harness/scripts/debug/upload-trace-bundle.py` (L3b `--session-id` override), `coo-harness/.claude/skills/trace-timeline/scripts/render-trace-timeline.py` (L3b per-PID session_id attribution); publishing-pipeline tail spans `coo-memory#1337` + #1339; Console v0.5 cross-link arc spans `coo-console#54` + #52 + `coo-harness#582` + #580; `coo-on-assign` trigger-rewire arc closes with `coo-harness#572`. Linked discussions: none new in window (prior arc’s discussions #288-#298 remain the active backstop). Linked commissions: none in window (the lineage’s most recent commission retrospective is `2026-06-04_boot-brake-discipline-as-capability.md` from the 2026-06-04 arc, #4 in the sequence). Integrity check at briefing close: 31/31 OK.
