

Day overview — 2026-06-09

vade-coo

2026-06-09

Table of contents

TL;DR	1
Lanes	1
Lane 1 — /day-overview reshape: six-section briefing-shape, 300-line cap	1
Lane 2 — lib/transcripts/ discoverability: skill + three boot signposts	2
Carry-forward	2
Next actions	3
Integrity & posture	3
Known bounds	3

TL;DR

- **[/day-overview](#) reshape lands** — six-section, ≤ 300 -line briefing-shape replaces 1000–1500-line walls; template + worked example bundled; format ratchet broken at source. #1348, closes #1347.
- **Three single-purpose fetch primitives bundled with the skill** — [fetch-memos.sh](#) / [fetch-prs.sh](#) / [fetch-followups.sh](#), reusable by future weekly-review and multi-repo rollups.
- **[lib/transcripts/](#) discoverability bridge across four repos** — new [/transcripts-lib](#) skill + boot signposts in coo-harness, coo-logs, coo-console CLAUDE.md. Closes the “session re-implements in [scripts/lib/](#)” failure mode.
- **2026-06-08 day-overview shipped via PR** at 05:04 UTC (#1346) — first daily overview merged under the new daily-routine cadence; the reshape work followed in the same session window.
- **Quiet day otherwise** — no memos issued, no other-repo substantive work; 31/31 integrity OK throughout.

Lanes

Lane 1 — [/day-overview](#) reshape: six-section briefing-shape, 300-line cap

#1348 replaces the prior 1000–1500-line walls with a fixed six-section format (TL;DR · Lanes · Carry-forward · Next actions · Integrity & posture · Known bounds), each with caps written inline at the point of writing rather than buried in §4 verify. Bundles [template.md](#) (scaffold) and [example.md](#) (the 2026-06-08 arc re-rendered into 115 lines) so the format reference no longer points at the most-recent prior output — that ratchet was the structural driver of the bloat, per the diagnosis in the PR body. Hard 300-line cap is mechanically enforced; ship aborts on over-cap. SKILL.md also factored the orchestrator into three single-purpose fetch primitives ([fetch-memos.sh](#), [fetch-prs.sh](#), [fetch-followups.sh](#)) that future multi-repo rollups can compose without re-running the day-overview shell.

Artifacts: coo-memory#1348, #1346 (2026-06-08 day-overview shipped under prior format), closes #1347; session log coo-logs#812. **Threads:** Today’s output is the first run under the new format — falsifier is whether next-day synthesizers stay under cap without compression rounds. coo-memory#1278 (briefing-NNN ref resolution) and #1275 (manifest 50/repo cap on multi-day arcs) remain open as targeted follow-ons.

Lane 2 — `lib/transcripts/` discoverability: skill + three boot signposts

Four-PR cluster closes the gap that recent sessions re-implemented JSONL parsing / R2 plumbing / sidecar shapes in `scripts/lib/` or `scripts/lifecycle/` instead of importing from `coo-harness/lib/transcripts/`. coo-memory#1344 adds the `/transcripts-lib` skill — keyword-triggered (`.meta.json`, `.analysis.json`, `session-end-transcript-*`, R2 ciphertext, corpus-index Action), third-person voice, explicit skip-for list, ~80 lines. The three sibling PRs add a “Transcript primitives” section to each repo’s boot CLAUDE.md so a fresh session sees the canonical library named at boot: coo-harness#586 (alongside `bin/coo-search` and `bin/op-read-rollup.py`), coo-logs#808 (for sidecar writers/readers under `transcripts/`), coo-console#57 (for routes that consume sidecar shapes — `/logs/`, future `/cost/ v2`). Together: boot-time discovery (CLAUDE.md edits) + keyword-triggered activation (skill) + canonical reference (existing `lib/transcripts/README.md`, unchanged).

Artifacts: coo-memory#1344, coo-harness#586, coo-logs#808, coo-console#57; auto-sidecars coo-logs#813, #815. **Threads:** Verification is observational — next session opening a transcript-shape task should see the skill auto-suggest at boot; failure mode (skill never fires when it should) surfaces in retrospective audits.

Carry-forward

- coo-memory#1342 — Console `/cost/ v2` close-out: subsume coo-logs#332, cross-link #1025 inventory.
- coo-memory#1341 — `operations/cost-rates.yaml` seed + per-month override convention.
- coo-memory#1338 — publish-affordance: detect closed-PR label, post manual-PR instructions instead of silent checkout fail.
- coo-memory#1336 — Epic: 1Password optimization.
- coo-memory#1278 — `/day-overview` should resolve briefing-NNN refs against `briefings/` before synthesis.
- coo-memory#1275 — manifest builder silently caps PR enumeration at 50/repo on multi-day arcs.
- coo-memory#1286 — type-instance frontmatter sibling migrations after #1135 (per MEMO-2026-06-07-fnzq).
- coo-memory#1290 — `/memo` skill SKILL.md + memo-write.sh + protocol update to YAML frontmatter.
- coo-memory#1321 — VADE Console v1+: dashboards, OAuth migration, live-data plane.
- coo-memory#1323 — Epic: Mem0 → Voyage+sqlite-vec migration Stage 2.
- coo-harness#584 — cost extractor: Stage-1.5 lifecycle script + `lib/transcripts.cost` primitive + `<id>.cost.json` sidecar.
- coo-harness#585 — cost backfill: operator-local R2 ciphertext pass.
- coo-harness#579 — Epic: harness portability initiative (Tracks 2–4 anchored).
- coo-harness#578 — F-invariant systemic gaps: App-bot authorship (F4) + `funding/billing/` scope (F1).
- coo-harness#563 — Phase-3 verification rerun: next cold-boot `.op-reads.jsonl` confirms <40 (carry from 06-08).
- coo-logs#776 — pre-aggregated nightly `index/session_logs.json` for Console v1 `/logs/`.
- coo-console#58 — r2-inventory drift 2026-06-09: 469 reconciliation miss(es).

Next actions

- **solo**: Propagate YAML frontmatter migration to next type-instance directory per MEMO-2026-06-07-fnzq (#1286).
- **solo**: Draft `operations/provider-matrix.md` (carry from 06-08 Lane 2).
- **solo**: Phase-3 verification rerun on next cold-boot; close coo-harness#563 with the figure.
- **solo**: Diagnose r2-inventory drift in coo-console#58 (recurring; #53 was 06-08).
- **op**: Kick off cost extractor coo-harness#584 — unblocks /cost/ v2 (coo-console#55).
- **op**: Observe July 1 Monthly Watch run; resolve in June 2026 billing draft if it doesn't compose (per MEMO-2026-06-08-3kmm).
- **cmte**: CB-010 candidate decision (multi-slice unresolved, deadline past per MEMO-2026-04-30-c7c4).
- **design**: F4 principled fix (accept `vade-coo-app[bot]` as COO attribution); F1 carve-out for `^funding/billing/` (coo-harness#578).

Integrity & posture

Boot integrity check green throughout: 31/31 OK; no degraded invariants surfaced. No env-block or `VADE_HARNESS_PROVIDER` changes landed. No bootstrap or PAT-cache anomalies recorded. Cloud build-time receipt from 2026-06-07T09:27:32Z still current; no settings sync drift. The Group S phase-split shipped 06-08 (MEMO-2026-06-08-mi7m) continues to await its post-merge cold-boot `.op-reads.jsonl` verification — no new data today.

Known bounds

- Mem0 boot reads disabled per briefing-036 effectiveness audit (coo-memory#684) — Mem0-readiness signals not surfaced.
- Manifest covers merged PRs only; draft PRs and open-but-pre-merge work invisible (e.g., today's session may have opened PRs that merge tomorrow).
- 9 merged PRs is a low count; some work likely landed inline (CLAUDE.md edits, skill author session) without separate threads — sub-agent and chat-mode activity not enumerated unless committed.
- Carry-forward hand-curated from `fetch-followups.sh` 7-day window; surface picks the subset, full list is in coo-labs/projects/1.
- No memos issued today — quiet day on case-law surface; lane synthesis traces back to PR bodies + #1347 plan-mode Q&A, not memos.
